## Project Design Phase-II Solution Requirements (Functional & Non-functional)

Date	08 October 2022
Team ID	PNT2022TMID15973
Project Name	Smart Waste Management System For
-	Metropolitan Cities
Maximum Marks	4 Marks

## **Functional Requirements:**

Following are the functional requirements of the proposed solution.

Functional	Sub Requirement (Story / Sub-Task)
Requirement (Epic)	, , , ,
Fitting IoT device in the	The IoT device need to be fixed in the dustbin with
ti asiicans.	
	Water proof safety. The IoT device consists
	Ultrasonic sensor, IR sensor, Weight
	sensor. To send data to the cloud
D ( ) III (	GPRS/GSM is used.
Detailed bin inventory.	All monitored bins and stands can be seen
	on the map, and you can visit them at any
	time via the Street View feature from
	Google.
	Bins or stands are visible on the map as
	green, orange or red circles.
	You can see bin details in the Dashboard –
	capacity, waste type, last measurement,
	GPS location and collection schedule or
	pick recognition.
Real Time Bin	The Dashboard displays real-time data on
monitoring	fill-levels of bins monitored by smart
	sensors.
	In addition to the % of fill-level, based on
	the historical data, the tool predicts when
	the bin will become full, one of the
	functionalities that are not included even in
	the best waste management software
	Requirement (Epic) Fitting IoT device in the trashcans.  Detailed bin inventory.  Real Time Bin

		Sensors recognize picks as well; so you can check when the bin was last collected. With real-time data and predictions, you can eliminate the overflowing bins and stop collecting half-empty ones.
FR-4	Expensive bins.	We help you identify bins that drive up your collection costs. The tool calculates a rating for each bin in terms of collection costs.  The tool considers the average distance depo-bin-discharge in the area. The tool assigns bin a rating (1-10) and calculates distance from depobin discharge
FR-5	Eliminate unefficient picks.	Eliminate the collection of half-empty bins. The sensors recognize picks. By using real-time data on fill-levels and pick recognition, we can show you how full the bins you collect are.
FR-6	Predictions for bin fullness	It is a 24×7 monitoring system is designed for monitoring the dumpster. If either of the containers is full then an alert message is sent from the dustbin to employees and the cloud. In turn, employees can clear the corresponding dumpster. The bin has Sensors that can recognize picks as well;so you can check when the bin was last collected. With real-time data and predictions, you can eliminate the overflowing bins and stop collecting half-empty ones.
FR-7	Plan waste collection routes	Based on current bin fill-levels and predictions of reaching full capacity, you are ready to respond and schedule waste collection. You can compare planned vs. executed routes to identify any inconsistencies.

## **Non-functional Requirements:**

Following are the non-functional requirements of proposed solution

FR	Non-Functional	Description
No.	Requirement	•
NFR-	Usability	A smart solution has been proposed to
1	1	make the waste by sorting more simple
		and accurate and improve the user
		experience, usability, and satisfaction. It
		aims to optimize ease of use while
		offering maximum functionality.
NFR-	Security	Building and deploying IoT-based
	-	smart waste
		management in cities can be a
		complex,time consuming and resource-
		intensive process. Many municipal IT
		departments will not have the resources
		or in-house skills to support such a
	project internally.	
NFR-	Reliability	Smart waste management is also about
3		creating better working conditions for
		waste collectors and drivers. Operates
		in a defined environment without
		failure resulting in less manpower,
		emissions, fuel use and traffic
		congestion.
NFR-	Performance	The system will provide accurate
4		reports, thus increasing the efficiency of
		the system. The real-time monitoring of
		the garbage level with the help of
		sensors and wireless communication
		will reduce the total number of trips
		required of Garbage collecting truck.
		This will reduce the total expenditure
		associated with the garbage collection.
NFR-	Availability	Another purpose of this project is to
5		make the
		proposed waste management system as
		cheap as possible. By this we empower
		cities, businesses, and countries to
		manage waste smarter.

NFR-	Scalability	Using smart waste bins reduce the
6		number of bins inside town, cities con
	we able to monitor the garbage 24/7	
	more cost effect and scalability when	
	we moves to smarter.
